Policy Research Institute of Market Economy (PRIME) is a public policy think tank striving for an open, free and prosperous Pakistan by creating and expanding a constituency for protective function of the state and freedom of the market. PRIME was established in Islamabad in 2013, and since then, it has published on a wide range of issues including trade, tax policy, business regulations, housing, public debt and energy crisis.

Pakistan Prosperity Report (PPR) is a monthly review of Pakistan's macro-economy based on the analysis of four periodic data sets- industrial production, trade volume, price levels, and private sector lending. The concept behind this report is intuitive- higher level of industrial output, increases in trade volumes, more lending to the private sector and an improvement in purchasing power of individuals are indicators of a strong economy, signaling prosperity of both firms and households.

Pakistan Prosperity Report

Indicators of prosperity exhibit improvement, face headwinds in the short term. Large-scale manufacturing and private sector investment improved, trade volume recovering, and purchasing power deteriorating.

Pakistan Prosperity Report (PPR) is a monthly review of Pakistan's macro-economy based on the analysis of four periodic data sets- industrial production, trade volume, price levels, and private sector lending. The concept behind this report is intuitive- higher level of industrial output, increases in trade volumes, more lending to the private sector and an improvement in purchasing power of individuals are indicators of a strong economy, signaling prosperity of both firms and households.

It is pertinent to mention that we consider increase in trade volume more important than a change in trade balance. Increase in trade volume contributes to prosperity by enhancing the production and variety of goods available for consumption and industrial activities thereby increasing the income and employment opportunities. On the other hand, higher rates of inflation reduce prosperity by eroding purchasing power and incomes of individuals. Increase in industrial output enhances prosperity by increasing employment prospects and income. In contrast, provision of finance for long-term investment increases prosperity by boosting industrial capacity resulting in an increased output, employment and income opportunities.

The analysis in PPR (March 2020) is based on the data for December 2019 and January 2020. For a long-term view, data for the period of June 2019-December 2019 is separately covered.

The report first provides a general overview of macro-economy and then provides a snapshot of its first month-to-month growth in the prosperity. The report concludes that over the second half of the FY 2019, Pakistan witnessed overall improvement in the prosperity based on an increase in both large scale manufacturing and investment in the private sector, though decreasing purchasing power and trade volumes resulted in headwinds. For the first month-to-month comparison, between December 2019 and January 2019, the report finds that Pakistan continued to exhibit improvement in prosperity indicators.

Future is less glossy. It is projected that amid the coronavirus pandemic, Pakistan’s trade volume will further shrink as a result of the slowdown in global demand. The production of Large-Scale Manufacturing Industries will also be adversely affected due to lockdown. However, commercial banks’ lending to private sector for long term fixed investment might increase with the hopes to stimulate export-oriented sectors. Meanwhile, inflation would remain high hovering around 13 percent due to decrease in domestic production and shortage of essential commodities. Low purchasing power, fear of losing jobs and low returns on investments upholds the bearish sentiments among the stakeholders of the economy in the coming months.
Economic Outlook: June 2019-December 2019

Prosperity Index

PPR estimates its own Prosperity Index based on these indices: 1/CPI denotes inverse of Consumer Price Index (CPI), QIM represents Quantum Index of Large-Scale Manufacturing Industries (QIM), TVI represents Trade Volume Index and LTFF represents Growth in Commercial Loans for Long-Term Financing Facility. Please refer to Annexure-A for details on methodology and calculations.

Monthly prosperity index has been calculated for June 2019 to January 2020. The results reveal an overall increase in prosperity between June 2019 and January 2020.

For January 2020, the month-on-month inflation rate increased by 2%, while the trade volume index, quantum index of LSMI and LTFF increased by 1.22%, 7.09% and 1.86% respectively.

The prosperity index estimated by using the January 2020 data on four indicators is 104.52. In order to determine if economic prosperity has increased or decreased, a base period is required. For the purpose, prosperity index of December 2019 has been used as a baseline which is calculated to be 102.99.

The analysis reveals economy’s prosperity has increased by 1.48 percent in January 2020 relative to December 2019. This increase in economic prosperity is largely attributable to an increase in long term financing facility, LSMI’s output and trade volume between December 2019 and January 2020 (see Figures 5, 7 and 8 on next page). It is pertinent to note that the purchasing power has decreased (see Figure 6) implying that the increase in inflation surpasses monetary gains (income) from expansion in industrial output and trade volume.

PPR Methodology and Indices Calculations

Variable Transformation

The Pakistan Prosperity Report utilizes data from Pakistan Bureau of Statistics (PBS), Pakistan Economic Survey and State Bank of Pakistan (SBP) on monthly basis. The analysis is contingent upon the growth rates of four macroeconomic indicators of prosperity i.e. Trade Volume, Consumer Price Index (CPI), Quantum Index of Large-Scale Manufacturing Industries (QIM) & Long-Term Financing Facility (LTFF).

Finding Growth

Data for Month-on-Month growth of Consumer Price Index (CPI) and Large-Scale Manufacturing Industry is extracted from PBS, while the growth of Trade volume and Loans to Private Sector (LTFF) is calculated by applying the conventional growth formula i.e.

\[
\text{Trade Volume/ LTFF Growth} = \left( \frac{\text{Current} - \text{Previous}}{\text{Previous}} \right) \times 100
\]

Rescaling

As the report is based on secondary data, it is obvious that growth rate for each of the variable is measured on different scales. Moreover, if a month shows zero growth, it will invalidate the whole formula of prosperity index, which is based on Geometric Mean.

Since the Trade Volume and Long-Term fixed Financing were not available in the form of index, the variables are first converted into indices, and then all the four variables were rescaled to measure
their impact on economic prosperity in same units. To avoid this discrepancy, the variables are rescaled and converted into indices, by considering the value of June = 100 as a base month.

**Calculations for Prosperity Index**

The Prosperity Index is calculated by using the geometric mean as employed by UNDP in calculating the Human Development Index. It is computed as follows:

\[
\text{Prosperity Index} = \sqrt[4]{a \times b \times c \times d} \tag{1}
\]

Where; “a” denotes Consumer Price Index (CPI), “b” represents Quantum Index of Large Scale Manufacturing Industries (QIM), “c” represents Trade Volume Index (TVI) and “d” represents the Index of Bank’s lending to Private sector i.e. Long-Term Financing Facility (LTFF Index).

Since the relationship between inflation and purchasing power is negative, inverse of CPI \(\frac{1}{CPI}\) is taken to depict that higher rate of inflation lowers purchasing power and hence prosperity. Trade volume is the sum of imports and exports, while LTFF offers business borrowings for long term projects particularly in Large Scale Manufacturing Industry (LSMI).

\[
\text{Prosperity Index} = \sqrt[4]{\frac{1}{CPI} \times QIM \times TVI \times LTFF} \tag{2}
\]
